

## SUCCESS STORY

# Mobile-native and web apps automated in a single go!

BeetleRim was asked to automate the client's mobile-native applications, which were also web-based.

### The challenges

- The automation script had to be written in the same language in which the applications were developed.
- This meant BeetleRim had to develop the scripts in C#, Dot Net using Visual Studio and Appium. This involved significant research.
- Multiple automation and development tools were used.

### The solution

After thorough research, BeetleRim built a single configurable and flexible framework to automate mobile-native and web apps.

The automation scripts developed could be executed from anywhere in the world using the client network.

Good research and analysis led to quality output in less time.

The BeetleRim QA (manual and automation) teams were easily adaptable to client requirements.

### Benefits

- Reduced manual regression and re-testing efforts.
- Ensured consistent quality in minimum time.
- Technology provided was conducive to the requirement.

### ...and key value propositions

Strong governance model

Improved efficiency and productivity

Time savings

Increased revenues

Enhanced customer delight
